Provide folder security on shares with access-based enumeration

Provide folder security on shares with access-based enumeration overview

When access-based enumeration (ABE) is enabled on an SMB share, users who do not have permission to access a folder or file contained within the share (whether through individual or group permission restrictions) do not see that shared resource displayed in their environment, although the share itself remains visible.

Conventional share properties allow you to specify which users (individually or in groups) have permission to view or modify files or folders contained within the share. However, they do not allow you to control whether folders or files within the share are visible to users who do not have permission to access them. This could pose problems if the names of these folders or files within the share describe sensitive information, such as the names of customers or products under development.

Access-based enumeration (ABE) extends share properties to include the enumeration of files and folders within the share. ABE therefore enables you to filter the display of files and folders within the share based on user access rights. That is, the share itself would be visible to all users, but files and folders within the share could be displayed to or hidden from designated users. In addition to protecting sensitive information in your workplace, ABE enables you to simplify the display of large directory structures for the benefit of users who do not need access to your full range of content. For example, the share itself would be visible to all users, but files and folders within the share could be displayed or hidden.

Enable or disable access-based enumeration on SMB shares

You can enable or disable access-based enumeration (ABE) on SMB shares to allow or prevent users from seeing shared resources that they do not have permission to access.

About this task

By default, ABE is disabled.

Steps

1. Perform one of the following actions:

If you want to...	Enter the command...
Enable ABE on a new share	<code>vsserver cifs share create -vserver vserver_name -share-name share_name -path path -share-properties access-based-enumeration</code> You can specify additional optional share settings and additional share properties when you create an SMB share. For more information, see the man page for the <code>vsserver cifs share create</code> command.

If you want to...	Enter the command...
Enable ABE on an existing share	<code>vserver cifs share properties add -vserver vserver_name -share-name share_name -share-properties access-based-enumeration</code> Existing share properties are preserved. The ABE share property is added to the existing list of share properties.
Disable ABE on an existing share	<code>vserver cifs share properties remove -vserver vserver_name -share-name share_name -share-properties access-based-enumeration</code> Other share properties are preserved. Only the ABE share property is removed from the list of share properties.

2. Verify that the share configuration is correct by using the `vserver cifs share show` command.

Examples

The following example creates an ABE SMB share named “sales” with a path of /sales on SVM vs1. The share is created with access-based-enumeration as a share property:

```
cluster1::> vserver cifs share create -vserver vs1 -share-name sales -path
/sales -share-properties access-based-
enumeration,oplocks,browsable,changenotify

cluster1::> vserver cifs share show -vserver vs1 -share-name sales

                Vserver: vs1
                Share: sales
CIFS Server NetBIOS Name: VS1
                Path: /sales
        Share Properties: access-based-enumeration
                        oplocks
                        browsable
                        changenotify
        Symlink Properties: enable
        File Mode Creation Mask: -
        Directory Mode Creation Mask: -
                Share Comment: -
                Share ACL: Everyone / Full Control
        File Attribute Cache Lifetime: -
                Volume Name: -
                Offline Files: manual
        Vscan File-Operations Profile: standard
```

The following example adds the access-based-enumeration share property to an SMB share named “data2”:

```
cluster1::> vserver cifs share properties add -vserver vs1 -share-name
data2 -share-properties access-based-enumeration

cluster1::> vserver cifs share show -vserver vs1 -share-name data2 -fields
share-name,share-properties
server  share-name share-properties
-----
vs1     data2      oplocks,browsable,changenotify,access-based-enumeration
```

Enable or disable access-based enumeration from a Windows client

You can enable or disable access-based enumeration (ABE) on SMB shares from a Windows client, which allows you to configure this share setting without needing to connect to the CIFS server.

The abecmd utility is not available in new versions of Windows Server and Windows clients. It was released as part of Windows Server 2008. Support ended for Windows Server 2008 on January 14, 2020.

Steps

1. From a Windows client that supports ABE, enter the following command: `abecmd [/enable | /disable] [/server CIFS_server_name] {/all | share_name}`

For more information about the abecmd command, see your Windows client documentation.
