# Set up namespaces for NVMe

## NVMe namespaces considerations

To set up the NVMe protocol in your SAN environment, you must configure an SVM for NVMe, create namespaces and subsystems, configure an NVMe/FC LIF, and then map the namespaces to the subsystems. There are certain considerations you should be aware of when working with NVMe namespaces.

- If you lose data in a LUN, it cannot be restored from a namespace, or vice versa.
- The space guarantee for namespaces is the same as the space guarantee of the containing volume.
- Beginning with ONTAP 9.6, namespaces support 512 byte blocks and 4096 byte blocks.

4096 is the default value. 512 should only be used if the host operating system does not support 4096 byte blocks.

- Namespaces do not support the following:

- Renaming

You cannot rename a namespace.

- Inter-volume move
- Inter-volume copy

Beginning with ONTAP 9.10.1, you can [resize a namespace](#). Resizing a namespace is not supported in releases prior to ONTAP 9.10.1.

## About NVMe namespaces

An NVMe namespace is a quantity of non-volatile memory (NVM) that can be formatted into logical blocks. Namespaces are used when a storage virtual machine is configured with the NVMe protocol and are the equivalent of LUNs for FC and iSCSI protocols.

One or more namespaces are provisioned and connected to an NVMe host. Each namespace can support various block sizes.

The NVMe protocol provides access to namespaces through multiple controllers. Using NVMe drivers, which are supported on most operating systems, solid state drive (SSD) namespaces appear as standard-block devices on which file systems and applications can be deployed without any modification.

A namespace ID (NSID) is an identifier used by a controller to provide access to a namespace. When setting the NSID for a host or host group, you also configure the accessibility to a volume by a host. A logical block can only be mapped to a single host group at a time, and a given host group does not have any duplicate NSIDs.

## NVMe subsystem provisioning for NVMe namespaces

An NVMe subsystem includes one or more NVMe controllers, namespaces, NVM subsystem ports, an NVM storage medium, and an interface between the controller and the NVM storage medium. When you create an NVMe namespace, you can choose to map an NVMe subsystem to the namespace, as follows:

- **None (default)** + No NVMe subsystems are mapped to the namespace.
- **Existing subsystem** + You can select an existing NVMe subsystem to map to the namespace. NVMe subsystems are listed based on the host OS and SVM fields. When you hover the pointer over the NVMe subsystem name, more details are shown about the subsystem.
- **New subsystem** + You can create a new NVMe subsystem and map it to the namespace. The subsystem is created on the host OS and SVM.

You provision a subsystem by providing the following details:

- **The NVMe subsystem name** + The NVMe subsystem name is case sensitive. It must contain 1 to 96 characters, and special characters are allowed.
- **Host OS** + The host OS type that the subsystem is being created on.
- **Host NQN** + The host NVMe qualification name attached to the controller. This column can contain comma-separated values because there can be from one to many hosts attached to a subsystem.

## Configure an SVM for NVMe

If you want to use the NVMe protocol on a node, you must configure your SVM specifically for NVMe.

### What you'll need

Your FC or Ethernet adapters must support NVMe. Supported adapters are listed in the [NetApp Hardware Universe](#).

### Steps

1. If you do not want to use an existing SVM, create one:

```
vserver create -vserver SVM_name
```

- a. Verify that the SVM is created:

```
vserver show
```

2. Verify that you have NVMe or TCP capable adapters installed in your cluster:

For NVMe: `network fcp adapter show -data-protocols-supported fc-nvme`

For TCP: `network port show`

3. If you are running ONTAP 9.7 or earlier, remove all protocols from the SVM:

```
vserver remove-protocols -vserver SVM_name -protocols iscsi,fcp,nfs,cifs,ndmp
```

Beginning with ONTAP 9.8, it is not necessary to remove other protocols when adding NVMe.

4. Add the NVMe protocol to the SVM:

```
vserver add-protocols -vserver SVM_name -protocols nvme
```

5. If you are running ONTAP 9.7 or earlier, verify that NVMe is the only protocol allowed on the SVM:

```
vserver show -vserver SVM_name -fields allowed-protocols
```

NVMe should be the only protocol displayed under the `allowed protocols` column.

6. Create the NVMe service:

```
vserver nvme create -vserver SVM_name
```

7. Verify that the NVMe service was created:

```
vserver nvme show -vserver SVM_name
```

The Administrative Status of the SVM should be listed as up.

8. Create an NVMe/FC LIF:

ONTAP version	Applicable protocols	Command
ONTAP 9.9.1 or earlier	FC	<pre>network interface create -vserver <i>SVM_name</i> -lif lif_name -role data -data -protocol fc-nvme -home -node home_node -home -port home_port</pre>
ONTAP 9.10.1	FC or TCP	<pre>network interface create -vserver <i>SVM_name</i> -lif lif_name -service-policy {default-data-nvme-tcp   default-data-nvme-fc} -home-node home_node -home-port home_port -status admin up -failover-policy disabled -firewall-policy data -auto-revert false -failover-group failover_group -is-dns -update-enabled false</pre>

9. Create an NVMe/FC LIF on the HA partner node:

ONTAP version	Applicable protocols	Command
ONTAP 9.9.1 or earlier	FC	<pre>network interface create -vserver <i>SVM_name</i> -lif lif_name -role data -data -protocol fc-nvme -home -node home_node -home -port home_port</pre>

ONTAP version	Applicable protocols	Command
ONTAP 9.10.1 or later	FC or TCP	<pre>network interface create -vserver SVM_name -lif lif_name -service-policy {default-data-nvme-tcp   default-data-nvme-fc} -home-node home_node -home-port home_port -status admin up -failover-policy disabled -firewall-policy data -auto-revert false -failover-group failover_group -is-dns -update-enabled false</pre>

10. Verify the NVMe/FC LIFs were created:

```
network interface show -vserver SVM_name
```

11. Create volume on the same node as the LIF:

```
vol create -vserver SVM_name -volume vol_name -aggregate aggregate_name -size
volume_size
```

If a warning message is displayed about the auto efficiency policy, it can be safely ignored.

## Create an NVMe namespace and subsystem

For systems using the NVMe protocol, you must create one or more NVMe namespaces and subsystems. Each namespace can then be mapped to an NVMe subsystem to allow data access from your host system.

### What you'll need

The SVM must already be configured for NVMe.

### Steps

1. Verify that the SVM is configured for NVMe:

```
vserver show -vserver SVM_name -fields allowed-protocols
```

NVMe should be displayed under the allowed-protocols column.

2. Create the NVMe namespace:

```
vserver nvme namespace create -vserver SVM_name -path path -size
size_of_namespace -ostype OS_type
```

3. Create the NVMe subsystem:

```
vserver nvme subsystem create -vserver SVM_name -subsystem name_of_subsystem
-ostype OS_type
```

4. Verify that the subsystem was created:

```
vserver nvme subsystem show -vserver SVM_name
```

The `nvme` subsystem should be displayed under the `Subsystem` column.

## About NVMe subsystems

An NVMe subsystem includes one or more controllers, one or more namespaces, one or more non-volatile memory (NVM) subsystem ports (FC-NVMe or RDMA transport ports), an NVM storage medium, and an interface between the controllers and the NVM storage medium. For controller mapping and management, an NVMe subsystem maps to a vserver in ONTAP.

An NVMe over Fabric (NVMeoF) subsystem is a separate kernel object that resides in the FreeBSD kernel. The NVMeoF subsystem interfaces with the following components:

- SAN components, such as BCOMKA, FCT, and VDOM
- WAFL
- RAS components, such as CM, ASUP, and EMS

All interfaces with NVMeoF subsystems adhere to the current definitions and patterns found in ONTAP.

## Map an NVMe namespace to a subsystem

You must map a namespace to a subsystem when using NVMe.

### What you'll need

- You must have configured an SVM for NVMe.
- You must have created an NVMe namespace and subsystem.

### About this task

A namespace can only be mapped to a single subsystem.

### Steps

1. Obtain the NQN from the host.
2. Add the host NQN to the subsystem:

```
vserver nvme subsystem host add -vserver SVM_name -subsystem subsystem_name
-host-nqn Host_NQN:subsystem.subsystem_name
```

3. Map the namespace to the subsystem:

```
vserver nvme subsystem map add -vserver SVM_name -subsystem subsystem_name
-path path
```

4. Verify that the namespace is mapped to the subsystem:

```
vserver nvme namespace show -vserver SVM_name -instance
```

The subsystem should be listed as the `Attached` subsystem.

## Convert a namespace into a LUN

Beginning with ONTAP 9.11.1, you can use the ONTAP CLI to in-place convert an existing NVMe namespace to a LUN.

### Before you start

- Specified NVMe namespace should not have any existing maps to a Subsystem.
- Namespace should not be part of a snapshot or on the destination side of SnapMirror relationship as a read-only namespace.
- Since NVMe namespaces are only supported with specific platforms and network cards, this feature only works with specific hardware.

### Steps

1. You enter the following command to convert an NVMe namespace to a LUN:

```
lun convert-from-namespace -vserver -namespace-path
```
