What should I do after reverting my cluster?

Verify cluster and storage health after downgrade or revert

After you downgrade or revert a cluster, you should verify that the nodes are healthy and eligible to participate in the cluster, and that the cluster is in quorum. You should also verify the status of your disks, aggregates, and volumes.

Verify cluster health

1. Verify that the nodes in the cluster are online and are eligible to participate in the cluster: cluster show

If any node is unhealthy or ineligible, check EMS logs for errors and take corrective action.

2. Set the privilege level to advanced:

```
set -privilege advanced
```

Enter y to continue.

- 3. Verify the configuration details for each RDB process.
 - The relational database epoch and database epochs should match for each node.
 - The per-ring quorum master should be the same for all nodes.

Note that each ring might have a different quorum master.

To display this RDB process	Enter this command
Management application	cluster ring show -unitname mgmt
Volume location database	cluster ring show -unitname vldb
Virtual-Interface manager	cluster ring show -unitname vifmgr
SAN management daemon	cluster ring show -unitname bcomd

This example shows the volume location database process:

<pre>cluster1::*> cluster ring show -unitname vldb</pre>						
Node	UnitName	Epoch	DB Epoch	DB Trnxs	Master	Online
node0	vldb	154	154	14847	node0	master
node1	vldb	154	154	14847	node0	secondary
node2	vldb	154	154	14847	node0	secondary
node3	vldb	154	154	14847	node0	secondary
4 entries	were disp	played.				

- 4. Return to the admin privilege level: set -privilege admin
- 5. If you are operating in a SAN environment, verify that each node is in a SAN quorum: event log show -severity informational -message-name scsiblade.*

The most recent scsiblade event message for each node should indicate that the scsi-blade is in quorum.

```
cluster1::*> event log show -severity informational -message-name scsiblade.*

Time Node Severity Event

MM/DD/YYYY TIME node0 INFORMATIONAL scsiblade.in.quorum: The scsi-blade ...

MM/DD/YYYY TIME node1 INFORMATIONAL scsiblade.in.quorum: The scsi-blade ...
```

System administration

Verify storage health

After you revert or downgrade a cluster, you should verify the status of your disks, aggregates, and volumes.

1. Verify disk status:

To check for	Do this
Broken disks	a. Display any broken disks: storage disk show -state brokenb. Remove or replace any broken disks.

To check for	Do this
Disks undergoing maintenance or reconstruction	 a. Display any disks in maintenance, pending, or reconstructing states: storage disk show -state maintenance pending reconstructing b. Wait for the maintenance or reconstruction operation to finish before proceeding.

2. Verify that all aggregates are online by displaying the state of physical and logical storage, including storage aggregates: storage aggregate show -state !online

This command displays the aggregates that are *not* online. All aggregates must be online before and after performing a major upgrade or reversion.

```
cluster1::> storage aggregate show -state !online
There are no entries matching your query.
```

3. Verify that all volumes are online by displaying any volumes that are *not* online: volume show -state !online

All volumes must be online before and after performing a major upgrade or reversion.

```
cluster1::> volume show -state !online
There are no entries matching your query.
```

4. Verify that there are no inconsistent volumes: volume show -is-inconsistent true

See the Knowledge Base article Volume Showing WAFL Inconsistent on how to address the inconsistent volumes.

Enable automatic switchover for MetroCluster configurations

This topic provides information regarding the additional tasks that you must perform after the reversion of MetroCluster configurations.

- 1. Enable automatic unplanned switchover: metrocluster modify -auto-switchover-failure -domain auso-on-cluster-disaster
- 2. Validate the MetroCluster configuration: metrocluster check run

Enable and revert LIFs to home ports after a revert

During a reboot, some LIFs might have been migrated to their assigned failover ports. After you revert a cluster, you must enable and revert any LIFs that are not on their home ports.

The network interface revert command reverts a LIF that is not currently on its home port back to its home port, provided that the home port is operational. A LIF's home port is specified when the LIF is created; you can determine the home port for a LIF by using the network interface show command.

1. Display the status of all LIFs: network interface show

This example displays the status of all LIFs for a storage virtual machine (SVM).

	Logical	~	w -vserver vs0 Network	Current	
Current Is					
Vserver Home	Interface	Admin/Oper	Address/Mask	Node	Port
vs0	_				
	data001	down/down	192.0.2.120/24	node0	e0e
true	data002	down/down	192.0.2.121/24	node0	e0f
true	uatavvz	down/ down	192.0.2.121/24	nodeo	601
	data003	down/down	192.0.2.122/24	node0	e2a
true	data004	down/down	192.0.2.123/24	node0	e2b
true					
£-1	data005	down/down	192.0.2.124/24	node0	e0e
false	data006	down/down	192.0.2.125/24	node0	e0f
false					
false	data007	down/down	192.0.2.126/24	node0	e2a
Laise	data008	down/down	192.0.2.127/24	node0	e2b
false					

If any LIFs appear with a Status Admin status of down or with an Is home status of false, continue with the next step.

2. Enable the data LIFs: network interface modify {-role data} -status-admin up

cluster1::> network interface modify {-role data} -status-admin up
8 entries were modified.

3. Revert LIFs to their home ports: network interface revert *

This command reverts all LIFs back to their home ports.

```
cluster1::> network interface revert *
8 entries were acted on.
```

4. Verify that all LIFs are in their home ports: network interface show

This example shows that all LIFs for SVM vs0 are on their home ports.

	Logical	Status	Network	Current	
Current Is	_		,	_	
Vserver Home	Interface	Admin/Oper	Address/Mask	Node	Port
	_				
vs0					
true	data001	up/up	192.0.2.120/24	node0	e0e
crue	data002	up/up	192.0.2.121/24	node0	eOf
true	1-+-002	/	100 0 0 100/04		- 2 -

true	datauus	up/up	192.0.2.124/24	nodei	eve
	data006	up/up	192.0.2.125/24	node1	eOf
true	data007	up/up	192.0.2.126/24	node1	e2a
true	da ca o o 7	αρ/ αρ	172.0.2.120/24	110061	62a
	data008	up/up	192.0.2.127/24	node1	e2b

Enable Snapshot copy policies after reverting

After reverting to an earlier version of ONTAP, you must enable Snapshot copy policies to

start creating Snapshot copies again.

You are reenabling the Snapshot schedules that you disabled before you reverted to an earlier version of ONTAP.

1. Enable Snapshot copy policies for all data SVMs:

```
volume snapshot policy modify -vserver * -enabled true
snapshot policy modify pg-rpo-hourly -enable true
```

2. For each node, enable the Snapshot copy policy of the root volume by using the run-nodenodenamevol optionsroot_vol_namenosnap off command.

```
cluster1::> run -node node1 vol options vol0 nosnap off
```

Verify client access (SMB and NFS)

For the configured protocols, test access from SMB and NFS clients to verify that the cluster is accessible.

Verify IPv6 firewall entries

A reversion from any version of ONTAP 9 might result in missing default IPv6 firewall entries for some services in firewall policies. You need to verify that the required firewall entries have been restored to your system.

1. Verify that all firewall policies are correct by comparing them to the default policies: system services firewall policy show

The following example shows the default policies:

```
cluster1::*> system services firewall policy show
              Service Action IP-List
Policy
               dns allow 0.0.0.0/0
              http allow 0.0.0.0/0
               https
                       allow 0.0.0.0/0
               ndmp
                        allow 0.0.0.0/0
               ntp
                       allow 0.0.0.0/0
               rsh
                        allow 0.0.0.0/0
                       allow 0.0.0.0/0
               snmp
                        allow 0.0.0.0/0
               ssh
               telnet
                        allow 0.0.0.0/0
data
                       allow 0.0.0.0/0, ::/0
               dns
                       deny 0.0.0.0/0, ::/0
               http
                        deny 0.0.0.0/0, ::/0
               https
                        allow 0.0.0.0/0, ::/0
               ndmp
                        deny 0.0.0.0/0, ::/0
               ntp
                        deny 0.0.0.0/0, ::/0
               rsh
```

2. Manually add any missing default IPv6 firewall entries by creating a new firewall policy: system services firewall policy create

```
cluster1::*> system services firewall policy create -policy newIPv6
-service ssh -action allow -ip-list ::/0
```

3. Apply the new policy to the LIF to allow access to a network service: network interface modify

```
cluster1::*> network interface modify -vserver VS1 -lif LIF1
-firewall-policy newIPv6
```

Revert password hash function to the supported encryption type

If you reverted from ONTAP 9.1 or ONTAP 9.0 to ONTAP 8.3.x, SHA-2 account users can no longer be authenticated with their passwords. Passwords must be reset to use the MDS encryption type.

- 1. Set a temporary password for each SHA-2 user account that you identified prior to reverting: security login password -username user name -vserver vserver name
- 2. Communicate the temporary password to the affected users and have them log in through a console or SSH session to change their passwords as prompted by the system.

Considerations for whether to manually update the SP firmware

If the SP automatic update functionality is enabled (the default), downgrading or reverting to ONTAP 8.3.x does not require a manual SP firmware update. The SP firmware is automatically updated to the newest compatible version that is supported by the ONTAP version you reverted or downgraded to.

If the SP automatic update functionality is disabled (not recommended), after the ONTAP revert or downgrade process is complete, you must manually update the SP firmware to a version that is supported for the ONTAP version you reverted or downgraded to.

NetApp Downloads: System Firmware and Diagnostics

Change in user accounts that can access the Service Processor

If you created user accounts on ONTAP 9.8 or earlier, upgraded to ONTAP 9.9.1 or later (when the -role parameter is changed to admin), and then reverted back to ONTAP 9.8 or earlier, the -role parameter is restored to its original value. You should nonetheless verify that the modified values are acceptable.

During revert, if the role for an SP user has been deleted, the "rbac.spuser.role.notfound" EMS message will be logged.

For more information, see Accounts that can access the SP.
