Update deprecated EMS event mapping

EMS event mapping models

Prior to ONTAP 9.0, EMS events could only be mapped to event destinations based on event name pattern matching. The ONTAP command sets (event destination, event route) that use this model continue to be available in the latest versions of ONTAP, but they have been deprecated starting with ONTAP 9.0.

Beginning with ONTAP 9.0, the best practice for ONTAP EMS event destination mapping is to use the more scalable event filter model in which pattern matching is done on multiple fields, using the event filter, event notification, and event notification destination command sets.

If your EMS mapping is configured using the deprecated commands, you should update your mapping to use the event filter, event notification, and event notification destination command sets.

There are two types of event destinations:

- 1. System-generated destinations: There are five system-generated event destinations (created by default)
 - ° allevents
 - ° asup
 - ° criticals
 - ° pager
 - ° traphost

Some of the system-generated destinations are for special purpose. For example, the asup destination routes callhome.* events to the AutoSupport module in ONTAP to generate AutoSupport messages.

2. **User-created destinations**: These are manually created using the event destination create command.

Name	Mail Dest.	SNMP Dest.	Syslog Dest.
Params			
allevents	_	_	_
false			
asup	_	_	_
false			
criticals	_	_	_
false			
pager	_	_	_

In the deprecated model, EMS events are individually mapped to a destination using the event route add-destinations command.

```
cluster-1::event*> route add-destinations -message-name raid.aggr.*
-destinations test
This command is deprecated. Use the "event filter", "event notification
destination" and "event notification" commands, instead.

```

The new, more scalable EMS event notifications mechanism is based on event filters and event notification destinations. Refer to the following KB article for detailed information on the new event notification mechanism:

Overview of Event Management System for ONTAP 9

Legacy routing based model

Event notification based model

Update EMS event mapping from deprecated ONTAP commands

If your EMS event mapping is currently configured using the deprecated ONTAP command sets (event destination, event route), you should follow this procedure to update your mapping to use the event filter, event notification, and event notification destination command sets.

Steps

1. List all the event destinations in the system using the event destination show command.

<pre>cluster-1::event*> destination show</pre>						
Hide						
Name	Mail Dest.	SNMP Dest.	Syslog Dest.			
Params						
allevents	-	-	-			
false						
asup	-	-	-			
false						
criticals	-	-	-			
false						
pager	-	-	-			
false						
test	test@xyz.com	-	-			
false						
traphost	-	-	-			
false						
6 entries wer	e displayed.					

2. For each destination, list the events being mapped to it using the event route show -destinations <destination name> command.

cluster-1::event*> route show -	-destinations tes	t		
	Freq			
Time				
Message	Severity	Destinations	Thresho	Ĺ
Threshd				
				-
raid.aggr.autoGrow.abort	NOTICE	test	0	0
raid.aggr.autoGrow.success	NOTICE	test	0	0
raid.aggr.lock.conflict	INFORMATIONAL	test	0	0
raid.aggr.log.CP.count	DEBUG	test	0	0
4 entries were displayed.				

3. Create a corresponding event filter which includes all these subsets of events. For example, if you want to include only the raid.aggr.* events, use a wildcard for the message-name parameter when creating the filter. You can also create filters for single events.

You can create up to 50 event filters.

4. Create an event notification destination for each of the event destination endpoints (i.e., SMTP/SNMP/syslog)

5. Create an event notification by mapping the event filter to the event notification destination.

6. Repeat steps 1-5 for each event destination that has an event route mapping.

Events routed to SNMP destinations should be mapped to the <code>snmp-traphost</code> event notification destination. The SNMP traphost destination uses the system configured SNMP traphost.
