# **SVM** data mobility

# **SVM** data mobility overview

Beginning with ONTAP 9.10.1, cluster administrators can non-disruptively relocate an SVM from a source cluster to a destination cluster to manage capacity and load balancing, or to enable equipment upgrades or data center consolidations. The feature is supported only on AFF arrays.

The SVM's name and UUID remain unchanged after migration, as well as the data LIF name, IP address, and object names, such as the volume name. The UUID of the objects in the SVM will be different.

### **SVM** migration workflow

The diagram depicts the typical workflow for an SVM migration. You start an SVM migration from the destination cluster. You can monitor the migration from either the source or the destination. You can perform a manual cutover or an automatic cutover. An automatic cutover is performed by default.

### Supported configurations

The table indicates the configurations supported and the ONTAP releases in which support is available.

Configuration supported in	ONTAP 9.10.1	<b>ONTAP 9.11.1</b>	
AFF arrays only	Yes	Yes	
Total arrays/Node pairs	1	3	

### **Prerequisites**

- · You are a cluster administrator
- The source and destination clusters are peered to each other
- The source and destination clusters have the Data Protection Bundle license installed
- All nodes in the source cluster must be running ONTAP 9.10.1 or later
- · All nodes in the source cluster must be running the same ONTAP version
- The destination cluster is at the same or newer effective cluster version (ECV) as the source cluster
- The source and destination clusters are in the same data network
- The source SVM contains fewer than the maximum number of supported data volumes for the release.

The maximum number of data volumes supported is 100.

- · Sufficient space for volume placement is available on the destination
- Onboard Key Manager must be configured on the destination if the source SVM has encrypted volumes

### **Conflicting operations**

You should check for operations that can conflict with an SVM migration:

- · No failover operations are in progress
- · WAFLIRON cannot be running
- Fingerprint is not in progress
- · Vol move, rehost, clone, create, convert or analytics are not running

### **Supported features**

The table indicates the features supported and the ONTAP releases in which support is available.

Feature supported in	ONTAP 9.10.1	ONTAP 9.11.1	Additional information
NFS v3, NFS v4.1, and NFS v4.2 protocols	Yes	Yes	
NetApp Volume Encryption	Yes	Yes	

Asynchronous SnapMirror source	No	Yes	FlexVol Sr most of the     Any ongoing cutover and the migration     Scheduled missed du	can continue as normal on napMirror relationships during e migration.  Ing transfers are canceled during and new transfers fail during and they cannot be restarted until ion completes.  If transfers that were canceled or ring the migration are not ally started after the migrate  When a SnapMirror source is migrated, ONTAP does not prevent deletion of the volume after migration until the SnapMirror update takes place after. This happens because SnapMirror-related information for migrated SnapMirror source volumes is known only after first update after migrate is complete.
SVM peering for SnapMirror applications	No	Yes		
External key manager	No	Yes		
Fanout relationships (the migrating source has a SnapMirror source volume with more than one destination)	No	Yes		
Job schedule replication	No	Yes	replicated duri manually crea with ONTAP 9	0.1, job schedules are not ng migration and must be ted on the destination. Beginning .11.1, job schedules used by the blicated automatically during

# **Unsupported features**

The following features are not supported with SVM migration:

- Anti-ransomware
- Asynchronous SnapMirror destination
- Auditing
- Cloud Volumes ONTAP

- Data protection volume
- FabricPools
- FAS arrays
- · Flash Pool aggregates
- FlexCache volumes
- FlexGroup volumes
- IPsec policy
- IPv6 LIFs
- · iSCSI workloads
- · Load-sharing mirrors
- MetroCluster
- NDMP
- SAN, NVMe over fiber, CIFS, VSCAN, NFS v4.0, vStorage, S3 replication
- SMTape
- SnapLock
- SVM-DR
- SVM migration when the source cluster's Onboard Key Manager (OKM) has Common Criteria (CC) mode enabled
- Synchronous SnapMirror, SnapMirror Business Continuity
- · System Manager
- · Qtree, Quota
- VIP/BGP LIF
- Virtual Storage Console for VMware vSphere (VSC is part of the ONTAP Tools for VMware vSphere virtual appliance beginning with VSC 7.0.)
- Volume clones

# Migrate an SVM

After an SVM migration has completed, clients are cut over to the destination cluster automatically and the unnecessary SVM is removed from the source cluster. Automatic cutover and automatic source cleanup are enabled by default. If necessary, you can disable client auto-cutover to suspend the migration before cutover occurs and you can also disable automatic source SVM cleanup.

• You can use the -auto-cutover false option to suspend the migration when automatic client cutover normally occurs and then manually perform the cutover later.

Manually cutover clients after SVM migration

• You can use the advance privilege -auto-source-cleanup false option to disable the removal of the source SVM after cutover and then trigger source cleanup manually later, after cutover.

#### Migrate an SVM with automatic cutover enabled

By default, clients are cut over to the destination cluster automatically when the migration is complete, and the unnecessary SVM is removed from the source cluster.

#### **Steps**

1. From the destination cluster, run the migration prechecks:

```
dest_cluster> vserver migrate start -vserver SVM_name -source-cluster
cluster_name -check-only true
```

2. From the destination cluster, start the SVM migration:

```
dest_cluster> vserver migrate start -vserver SVM_name -source-cluster
cluster name
```

3. Check the migration status:

```
dest cluster> vserver migrate show
```

The status displays migrate-complete when the SVM migration is finished.

### Migrate an SVM with automatic client cutover disabled

You can use the -auto-cutover false option to suspend the migration when automatic client cutover normally occurs and then manually perform the cutover later. See "Manually cut over clients after SVM migration."

#### **Steps**

1. From the destination cluster, run the migration prechecks:

```
dest_cluster> vserver migrate start -vserver SVM_name -source-cluster
cluster name -check-only true
```

2. From the destination cluster, start the SVM migration:

```
dest_cluster> vserver migrate start -vserver SVM_name -source-cluster
cluster name -auto-cutover false
```

3. Check the migration status:

dest\_cluster> vserver migrate show The status displays ready-for-cutover when SVM migration completes the asynchronous data transfers, and it is ready for cutover operation.

### Migrate an SVM with source cleanup disabled

You can use the advance privilege -auto-source-cleanup false option to disable the removal of the source SVM after cutover and then trigger source cleanup manually later, after cutover. See "Manually clean up source after cutover."

#### **Steps**

1. From the destination cluster, run the migration prechecks:

```
dest_cluster*> vserver migrate start -vserver SVM_name -source-cluster
cluster_name -check-only true
```

2. From the destination cluster, start the SVM migration:

```
dest_cluster*> vserver migrate start -vserver SVM_name -source-cluster
cluster name -auto-source-cleanup false
```

3. Check the migration status:

```
dest cluster*> vserver migrate show
```

The status displays ready-for-source-cleanup when SVM migration cutover is complete, and it is ready to remove the SVM on the source cluster.

## Monitor volume migration

In addition to monitoring the overall SVM migration with the vserver migrate show command, you can monitor the migration status of the volumes the SVM contains.

#### **Steps**

1. Check volume migration status:

```
dest clust> vserver migrate show-volume
```

# Pause and resume SVM migration

You might want to pause an SVM migration before the migration cutover begins. You can pause an SVM migration using the vserver migrate pause command.

### Pause migration

You can pause an SVM migration before client cutover starts by using the vserver migrate pause command.

#### **Steps**

1. From the destination cluster, pause the migration:

```
dest cluster> vserver migrate pause -vserver <vserver name>
```

### **Resume migrations**

When you're ready to resume a paused SVM migration or when an SVM migration fails, you can use the vserver migrate resume command.

#### Step

1. Resume SVM migration:

```
dest cluster> vserver migrate resume
```

2. Verify that the SVM migration has resumed, and monitor the progress:

```
dest cluster> vserver migrate show
```

## **Cancel an SVM migration**

If you need to cancel an SVM migration before it completes, you can use the <code>vserver</code> migrate abort command. You can cancel an SVM migration only when the operation is in the paused or failed state. You cannot cancel an SVM migration when the status is "cutover-started" or after cutover is complete. You cannot use the <code>abort</code> option when an SVM migration is in progress.

#### **Steps**

1. Check the migration status:

```
dest cluster> vserver migrate show -vserver <vserver name>
```

2. Cancel the migration:

dest\_cluster> vserver migrate abort -vserver <vserver name> Check the progress of the cancel operation:

dest\_cluster> vserver migrate show The migration status shows migrate-aborting while the cancel operation is in progress. When the cancel operation completes, the migration status shows nothing.

### Manually cut over clients

By default, client cutover to the destination cluster is performed automatically after the SVM migration reaches "ready-for-cutover" state. If you choose to disable automatic client cutover, you need to perform the client cutover manually.

#### Steps

1. Manually execute client cutover:

```
dest cluster> vserver migrate cutover -vserver <vserver name>
```

2. Check the status of the cutover operation:

```
dest cluster> vserver migrate show
```

# Manually remove source SVM after client cutover

If you performed the SVM migration with source cleanup disabled, you can remove the source SVM manually after client cutover is complete.

#### **Steps**

1. Verify they status is ready for source cleanup:

dest\_cluster> vserver migrate show

2. Clean up the source:

dest\_cluster> vserver migrate source-cleanup -vserver <vserver\_name>
