Monitor SMB activity

Display SMB session information

You can display information about established SMB sessions, including the SMB connection and session ID and the IP address of the workstation using the session. You can display information about the session's SMB protocol version and continuously available protection level, which helps you identify whether the session supports nondisruptive operations.

About this task

You can display information for all of the sessions on your SVM in summary form. However, in many cases, the amount of output that is returned is large. You can customize what information is displayed in the output by specifying optional parameters:

- You can use the optional `-fields` parameter to display output about the fields you choose.

  You can enter `-fields ?` to determine what fields you can use.

- You can use the `-instance` parameter to display detailed information about established SMB sessions.

- You can use the `-fields` parameter or the `-instance` parameter either alone or in combination with other optional parameters.

Step

1. Perform one of the following actions:

If you want to display SMB session information…	Enter the following command…
For all sessions on the SVM in summary form	`vserver cifs session show -vserver vserver_name`
On a specified connection ID	`vserver cifs session show -vserver vserver_name -connection-id integer`
From a specified workstation IP address	`vserver cifs session show -vserver vserver_name -address workstation_IP_address`
On a specified LIF IP address	`vserver cifs session show -vserver vserver_name -lif-address LIF_IP_address`
On a specified node	`vserver cifs session show -vserver vserver_name -node {node_name|local}`

If you want to display SMB session information…	Enter the following command…
From a specified Windows user	`vserver cifs session show -vserver vserver_name -windows-user domain_name\\user_name`
With a specified authentication mechanism	`vserver cifs session show -vserver vserver_name -auth-mechanism {NTLMv1|NTLMv2|Kerberos|Anonymous}`
With a specified protocol version	`vserver cifs session show -vserver vserver_name -protocol-version {SMB1|SMB2|SMB2_1|SMB3|SMB3_1}` ⓘ Continuously available protection and SMB Multichannel are available only on SMB 3.0 and later sessions. To view their status on all qualifying sessions, you should specify this parameter with the value set to `SMB3` or later.
With a specified level of continuously available protection	`vserver cifs session show -vserver vserver_name -continuously-available {No|Yes|Partial}` ⓘ If the continuously available status is `Partial`, this means that the session contains at least one open continuously available file, but the session has some files that are not open with continuously available protection. You can use the `vserver cifs sessions file show` command to determine which files on the established session are not open with continuously available protection.
With a specified SMB signing session status	`vserver cifs session show -vserver vserver_name -is-session-signed {true|false}`

Examples

The following command displays session information for the sessions on SVM vs1 established from a workstation with IP address 10.1.1.1:

```
cluster1::> vserver cifs session show -address 10.1.1.1
Node:    node1
Vserver: vs1
Connection Session                                      Open        Idle
ID          ID     Workstation      Windows User   Files        Time
----------  ------ ---------------- ------------- ------- ------------
3151272279,
3151272280,
3151272281  1      10.1.1.1         DOMAIN\joe         2          23s
```

The following command displays detailed session information for sessions with continuously available protection on SVM vs1. The connection was made by using the domain account.

```
cluster1::> vserver cifs session show -instance -continuously-available
Yes

                      Node: node1
                   Vserver: vs1
                Session ID: 1
             Connection ID: 3151274158
Incoming Data LIF IP Address: 10.2.1.1
    Workstation IP address: 10.1.1.2
    Authentication Mechanism: Kerberos
             Windows User: DOMAIN\SERVER1$
                UNIX User: pcuser
               Open Shares: 1
                Open Files: 1
                Open Other: 0
            Connected Time: 10m 43s
                Idle Time: 1m 19s
          Protocol Version: SMB3
     Continuously Available: Yes
         Is Session Signed: false
     User Authenticated as: domain-user
              NetBIOS Name: -
      SMB Encryption Status: Unencrypted
```

The following command displays session information on a session using SMB 3.0 and SMB Multichannel on SVM vs1. In the example, the user connected to this share from an SMB 3.0 capable client by using the LIF IP address; therefore, the authentication mechanism defaulted to NTLMv2. The connection must be made by using Kerberos authentication to connect with continuously available protection.

```
cluster1::> vserver cifs session show -instance -protocol-version SMB3

                         Node: node1
                      Vserver: vs1
                   Session ID: 1
             **Connection IDs: 3151272607,31512726078,3151272609
            Connection Count: 3**
Incoming Data LIF IP Address: 10.2.1.2
       Workstation IP address: 10.1.1.3
      Authentication Mechanism: NTLMv2
                 Windows User: DOMAIN\administrator
                    UNIX User: pcuser
                  Open Shares: 1
                   Open Files: 0
                   Open Other: 0
               Connected Time: 6m 22s
                    Idle Time: 5m 42s
             Protocol Version: SMB3
        Continuously Available: No
             Is Session Signed: false
         User Authenticated as: domain-user
                 NetBIOS Name: -
         SMB Encryption Status: Unencrypted
```

Related information

Displaying information about open SMB files

Display information about open SMB files

You can display information about open SMB files, including the SMB connection and session ID, the hosting volume, the share name, and the share path. You can display information about a file's continuously available protection level, which is helpful in determining whether an open file is in a state that supports nondisruptive operations.

About this task

You can display information about open files on an established SMB session. The displayed information is useful when you need to determine SMB session information for particular files within an SMB session.

For example, if you have an SMB session where some of the open files are open with continuously available protection and some are not open with continuously available protection (the value for the `-continuously -available` field in `vserver cifs session show` command output is `Partial`), you can determine which files are not continuously available by using this command.

You can display information for all open files on established SMB sessions on storage virtual machines (SVMs) in summary form by using the `vserver cifs session file show` command without any optional parameters.

However, in many cases, the amount of output returned is large. You can customize what information is displayed in the output by specifying optional parameters. This can be helpful when you want to view information for only a small subset of open files.

- You can use the optional `-fields` parameter to display output on the fields you choose.

  You can use this parameter either alone or in combination with other optional parameters.

- You can use the `-instance` parameter to display detailed information about open SMB files.

  You can use this parameter either alone or in combination with other optional parameters.

Step

1. Perform one of the following actions:

If you want to display open SMB files…	Enter the following command…
On the SVM in summary form	`vserver cifs session file show -vserver vserver_name`
On a specified node	`vserver cifs session file show -vserver vserver_name -node {node_name|local}`
On a specified file ID	`vserver cifs session file show -vserver vserver_name -file-id integer`
On a specified SMB connection ID	`vserver cifs session file show -vserver vserver_name -connection-id integer`
On a specified SMB session ID	`vserver cifs session file show -vserver vserver_name -session-id integer`
On the specified hosting aggregate	`vserver cifs session file show -vserver vserver_name -hosting-aggregate aggregate_name`
On the specified volume	`vserver cifs session file show -vserver vserver_name -hosting-volume volume_name`
On the specified SMB share	`vserver cifs session file show -vserver vserver_name -share share_name`

If you want to display open SMB files…	Enter the following command…
On the specified SMB path	`vserver cifs session file show -vserver vserver_name -path path`
With the specified level of continuously available protection	`vserver cifs session file show -vserver vserver_name -continuously -available {No|Yes}` (i) If the continuously available status is `No`, this means that these open files are not capable of nondisruptively recovering from takeover and giveback. They also cannot recover from general aggregate relocation between partners in a high-availability relationship.
With the specified reconnected state	`vserver cifs session file show -vserver vserver_name -reconnected {No|Yes}` (i) If the reconnected state is `No`, the open file is not reconnected after a disconnection event. This can mean that the file was never disconnected, or that the file was disconnected and is not successfully reconnected. If the reconnected state is `Yes`, this means that the open file is successfully reconnected after a disconnection event.

There are additional optional parameters that you can use to refine the output results. See the man page for more information.

Examples

The following example displays information about open files on SVM vs1:

```
cluster1::> vserver cifs session file show -vserver vs1
Node:        node1
Vserver:     vs1
Connection: 3151274158
Session:     1
File    File       Open Hosting                 Continuously
ID      Type       Mode Volume     Share         Available
------- --------- ---- --------- ----------- ------------
41      Regular    r    data       data          Yes
Path: \mytest.rtf
```

The following example displays detailed information about open SMB files with file ID 82 on SVM vs1:

```
cluster1::> vserver cifs session file show -vserver vs1 -file-id 82
-instance

                     Node: node1
                  Vserver: vs1
                  File ID: 82
            Connection ID: 104617
               Session ID: 1
                File Type: Regular
                Open Mode: rw
  Aggregate Hosting File: aggr1
     Volume Hosting File: data1
               CIFS Share: data1
    Path from CIFS Share: windows\win8\test\test.txt
               Share Mode: rw
              Range Locks: 1
    Continuously Available: Yes
              Reconnected: No
```

Displaying SMB session information

Determine which statistics objects and counters are available

Before you can obtain information about CIFS, SMB, auditing, and BranchCache hash statistics and monitor performance, you must know which objects and counters are available from which you can obtain data.

Steps

1. Set the privilege level to advanced: `set -privilege advanced`

2. Perform one of the following actions:

If you want to determine…	Enter…
Which objects are available	`statistics catalog object show`
Specific objects that are available	`statistics catalog object show object object_name`
Which counters are available	`statistics catalog counter show object object_name`

See the man pages for more information about which objects and counters are available.

3. Return to the admin privilege level: `set -privilege admin`

Examples

The following command displays descriptions of selected statistic objects related to CIFS and SMB access in the cluster as seen at the advanced privilege level:

```
cluster1::> set -privilege advanced

Warning: These advanced commands are potentially dangerous; use them only
when directed to do so by support personnel.

Related information

Displaying statistics

10

Display statistics

You can display various statistics, including statistics about CIFS and SMB, auditing, and BranchCache hashes, to monitor performance and diagnose issues.

Before you begin

You must have collected data samples by using the `statistics start` and `statistics stop` commands before you can display information about objects.

Steps

1. Set the privilege level to advanced: `set -privilege advanced`

2. Perform one of the following actions:

If you want to display statistics for…	Enter…
All versions of SMB	`statistics show -object cifs`
SMB 1.0	`statistics show -object smb1`
SMB 2.x and SMB 3.0	`statistics show -object smb2`
CIFS subsystem of the node	`statistics show -object nblade_cifs`
Multiprotocol audit	`statistics show -object audit_ng`
BranchCache hash service	`statistics show -object hashd`
Dynamic DNS	`statistics show -object ddns_update`

   See the man page for each command for more information.

3. Return to the admin privilege level: `set -privilege admin`
